

Pbs De-Ice Boot System.

Boot Sealant

Pbs Boot Sealant dries quickly to a high gloss finish while offering the longest lasting protection against all weather, wear, and tear. No more black streaks on wings from oily products that fly off. Helps in preventing dry rot.

Light Plane Maintenance Magazine article stated, "Make no mistake, the Pbs Boot system is the best boot treatment we've ever seen. Your boots, no matter how old, grungy, yellowed, waxed over or dull, will come out looking better than new. The results are nothing short of stunning."

AOPA Magazine stated, "So far the best product we've used on boots is Pbs made by Jet Stream Products."

TIPS: To clean bugs, dust, and dirt from boots between flights, simply use a damp cloth and wipe clean. Apply additional coats of Pbs Sealant as needed to maintain high gloss and protection. Never use products containing ammonia like Windex to clean boots. A damp towel is all you need.

*The World's #1 Best Selling De-Ice Boot Treatment in The Aviation Industry. Air New Zealand uses the Pbs Boot System exclusively on their entire fleet of ATR72-212A aircraft as of January 2023.

*Approved by Aerazur Company for use on TBM de-icing boots.

* Dries quickly * High gloss finish * Long lasting protection * Protects against weather, wear, and tear.

* Prevents black streaks on wings * Prepare de-icers with Jet Stream Products Pbs Prep before use.

* For best results, apply with a microfiber applicator.

* Allow each coat to dry before adding extra coats. Recommended 3-5 coats. Allow each coat to fully dry.

Application Procedure

Set up: To begin the Pbs de-ice boot system application process, you must first have all the proper items available for the job. As you can see in the photo on the left, you will need a pair of latex gloves, a bucket of water, scrubbing sponge, rinsing sponge, microfiber applicator, Pbs Boot Sealant and Pbs Prep. With products and accessories in hand, you are now ready for prepping and sealing your de-ice boots.

Step 1: Cleaning Boots

Put on latex gloves. Apply the Pbs Prep directly to the scrubbing sponge as shown in photo. Using the soft side of the sponge, apply the Pbs Prep to the de-ice boot. By keeping the de-ice boots wet with Pbs Prep for 2 to 3 minutes, all old boot treatments will begin dissolving. At this point, use the scrubbing side of sponge to help re-move old boot treatments. De-ice boot should now be ready for rinsing.

Step 2: Rinsing Boots.

Rinse sponge in clean water as shown in photo on left. Thoroughly re-move all old, dissolved boot treatments. During this process, you will notice excessive amounts of black oxidation coming from surface of boot, this is normal. After drying de-ice boot, it should be flat black in colour and free of all old treatments. Note: If de-ice boot is not free of all old treatments, you will need to repeat step one. When completely free of all old treatments, boot will be ready to be treated with Pbs Boot Sealant.

Step 3: Applying Pbs Boot Sealant.

Apply Pbs Boot Sealant directly on a clean microfiber applicator. Using the treated microfiber applicator apply the Pbs Boot Sealant to de-ice boot in one direction. Apply 3 to 5 coats allowing each coat to dry before applying the next coat. When the de-ice boot is completed, it will have a wet glossy appearance, but will be dry to the touch.
